An **antiderivative** of a function f(x) is a function F(x) with F'(x) = f(x).

If F(x) is a particular antiderivative of f(x), then so is F(x) + C for any constant *C*.

If the domain of f(x) is an interval, and if F(x) is a particular rantiderivative of f(x), then any antiderivative has the form F(x) + C for some constant *C*.

If F(x) and G(x) are antiderivatives of f(x) and g(x) then

- aF(x) is an antiderivative of af(x) for any constant *a*.
- F(x) + G(x) is an antiderivative of f(x) + g(x).
- **1.** Find a particular antiderivative of  $x x^2 + 9$ .

**2.** Find all antiderivatives of  $x - x^2 + 9$ .

**3.** Find an antiderivative of  $1/x^2$ .

**4.** If F(x) is your answer to the previous problem, does every antiderivative of  $1/x^2$  have the form F(x) + C for some constant *C*?

Function	Antiderivative	Function	Antiderivative
x		sin(x)	
<i>x</i> <sup>2</sup>		$\cos(x)$	
<i>x</i> <sup>3</sup>		e <sup>x</sup>	
$x^k \ (k \neq -1)$		$1/(1+x^2)$	
$x^{-1}$ for $x > 0$		$\sec^2(x)$	
$x^{-1}$ for $x < 0$		$\sec(x)\tan(x)$	
$x^{-1}$ for all $x$		1	

5. For each of the following functions, find a particular antiderivative.

**6.** Compute three different antiderivatives of  $f(x) = x^{20} + 4x^{10} + 8$ 

7. Compute an antiderivative of 
$$f(t) = \frac{5 \sec t \tan t}{3} - 4 \sin t - \frac{1}{t} + e^2$$

**8.** Compute an antiderivative of  $f(x) = \cos(3x)$ .

**9.** Compute the antiderivative of  $f(t) = t^2$  that equals 5 when t = 2.

10. A particle moves in a straight line and has acceleration given by  $a(t) = 5 \cos t - 2 \sin t$ . Its initial velocity is v(0) = -6 m/s and its initial position is s(0) = 2 m. Find its position function s(t).

11. A stone is dropped from a cliff and hits the ground three seconds later. How high is the cliff? (Acceleration due to gravity is  $9.8 \text{ m/s}^2$ .)

12. What constant acceleration is needed to take a car from 10 mph to 60 mph in 5 seconds?
